Introduction- MBR Terneuzen

MBR		Terneuzen (The Netherlands)
Population equivalent	-	15,500
Location of the membranes	-	External (Side-stream)
Membrane supplier	-	Pentair (X-flow)
Membrane pore size	µm	0.045 (...)
Total membrane area	m ²	13,860
Volume biological tanks	m ³	784 (aerobic) 652 (anoxic)
Flux (average operation)	L/m ² .h	25-40
MLSS	g/L	8
Sludge age	d	± 20
Cleaning	-	Mechanical and chemical

Filterability

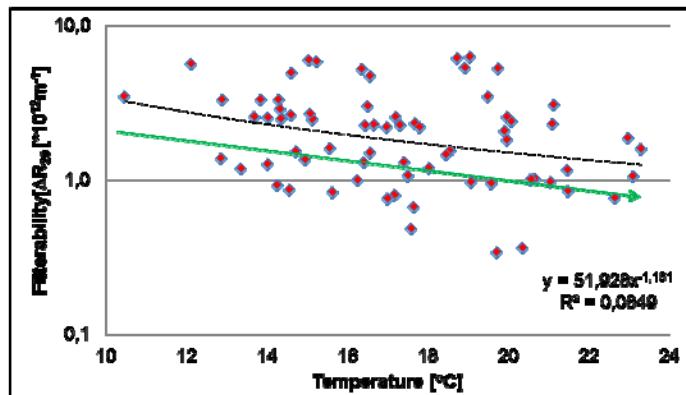

Filterability

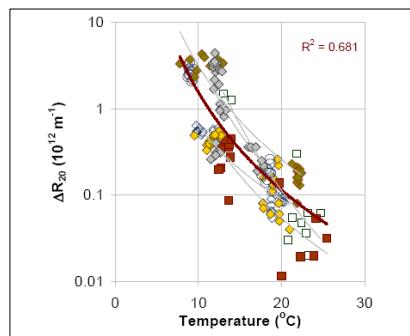

Factors affecting filterability:

- Temperature
- Substrate
- Sludge coagulants
- Influent composition
- Effluent addition
- Mechanical stress

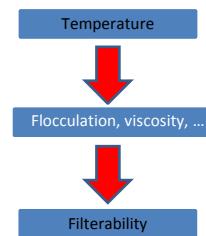

Filterability and temperature

Filterability and temperature

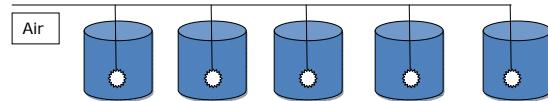

- Relation between filterability and temperature is overall accepted.
- Temperature has an indirect effect on filterability

Filterability and temperature in 7 full-scale MBRs
 (6 with submerged membranes, 1 with side-stream membranes) [Moreau, 2011]

Filterability and substrate

Batch tests (long term: 4 days)

	Flow-Proportional to real MBR situation	Flow-Applied in the substrate batch tests	F/M –Applied in the substrate batch tests [g BOD ₅ /gMLSS.d]	
			Day 1	Day 2 and Day 3
Glycerol	0.25 mL/d	0.25 L/d	1.07	0.24
Kwalidrink	2 mL/d	2 L/d	2.1	0.54

Filterability and substrate

Batch tests: long term (MBR Terneuzen)

Filterability and substrate

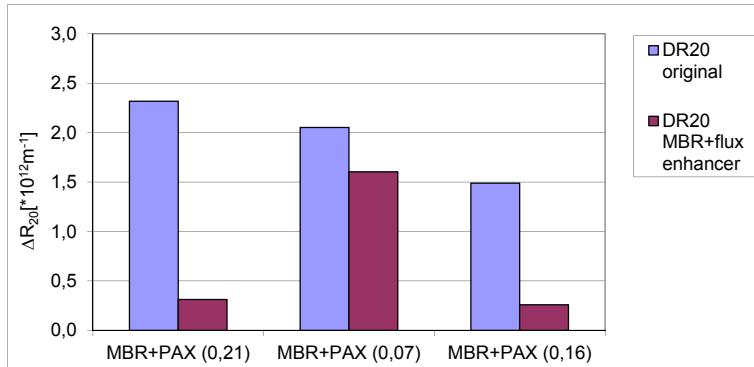

Filterability and sludge coagulants

Batch tests (short term: ½ hour)

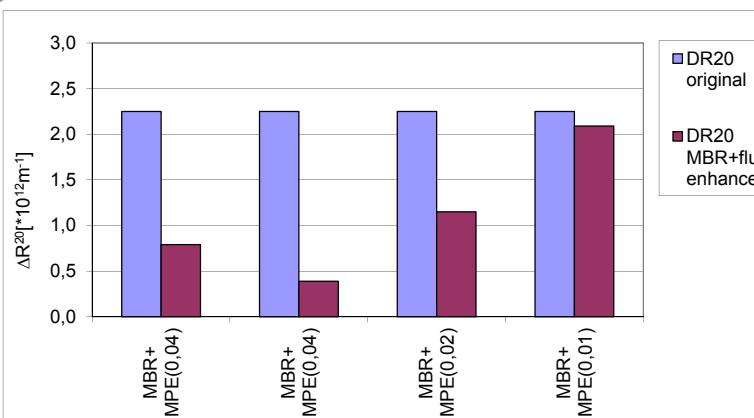

Commercial name	Company	Composition
PAX-14	Kemwater TM	Polyaluminum Chloride
MPE 50	Nalco	Polymers

Date	MLSS sludge[g/L]	L Enhancer/kg MLSS
PAX-14		
19-March-12	6.6	0.21
26-March-12	3.89	0.07
24-April-12	6.18	0.16
MPE 50		
14-March-12	6.16	0.04
3-May-12	6.22	0.04
3-May-12	6.22	0.02
3-May-12	6.22	0.01

Filterability and sludge coagulants

Filterability and sludge coagulants

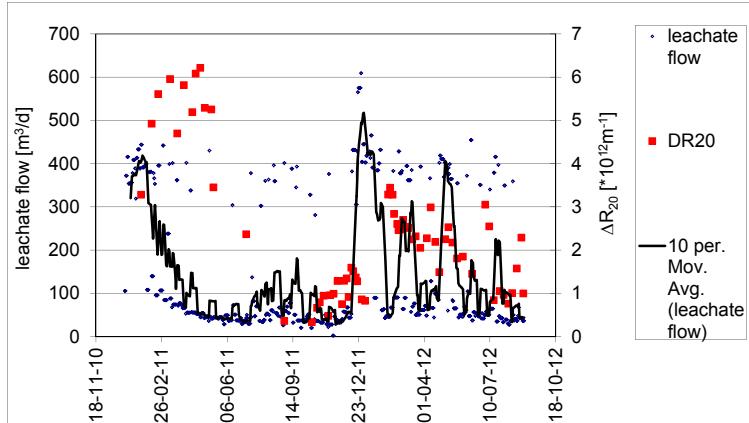

Filterability and sludge coagulants

Filterability and influent composition

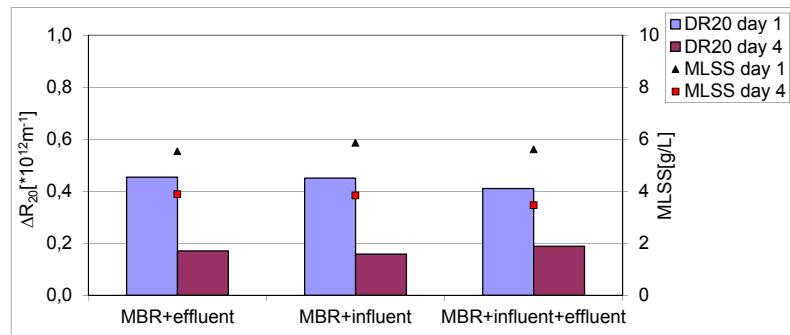

1. Koegors land fill
 1. About 30 years; no longer in use.
 2. Until the 80's: domestic use
 3. After the 80's: non-toxic industrial waste
2. Indaver- Location Hoek
 1. Dangerous waste "Indaver Gevaarlijk Afval"
 2. Transfer location, wastewater treatment plant and cleaning installation for trucks and trains.
 3. Started discharging: 23 january 2012

Filterability and influent composition

Filterability and effluent addition

Hypothesis: Effluent addition leads to the accumulation of submicron particles in the MBR sludge

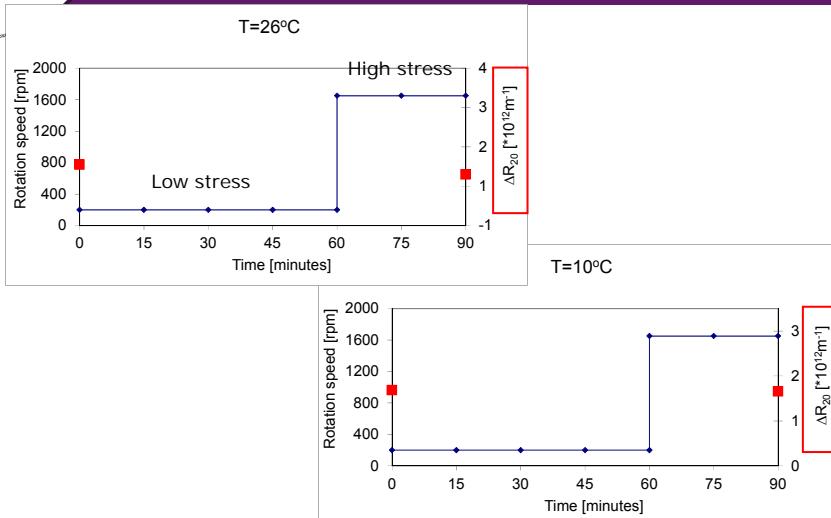

Filterability and effluent addition

	Day 1 [L]			Super-natant removed	Day 2 [L]			Super-natant removed	Day 3 [L]			Super-natant removed	Day 4 [L]		
	sludge	influent	effluent		sludge	influent	effluent		sludge	influent	effluent		sludge	influent	effluent
MBR+influent	20	5		0	0	5		0	0	1		0	0	0	0
MBR+ effluent	20		5	0	0		5	0	0		1	0	0	0	0
MBR+ influent +effluent	20	2,5	2,5	0	0	2,5	2,5	0	0	0,5	0,5	0	0	0	0

Filterability and mechanical stress

Conclusions

- The effect of different factors in filterability has to be evaluated by analyzing each factor separately.
- The influence of temperature on filterability is always present.
- Excess of substrate can deteriorate filterability; the substrate itself is not toxic but the amount might be.
- Filterability can be improved with coagulants.
- Influent composition, effluent addition and mechanical stress are likely to influence filterability.
