7. Interactions between wastewater collection and treatment

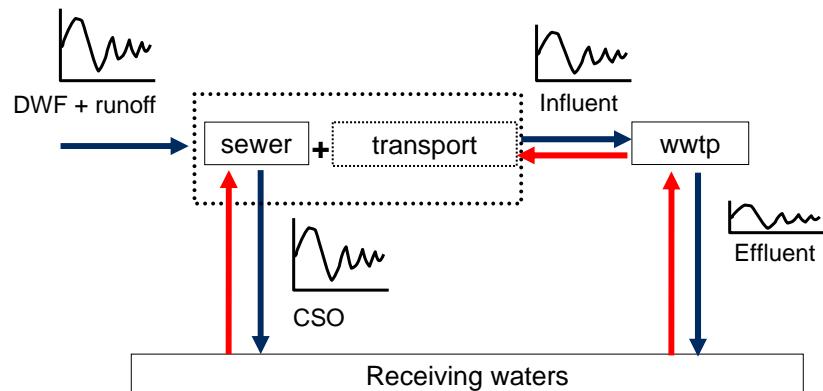

# CT4485 Wastewater Treatment

## Lecture: Interactions between wastewater collection and treatment

Dr. Ir. J.G. Langeveld

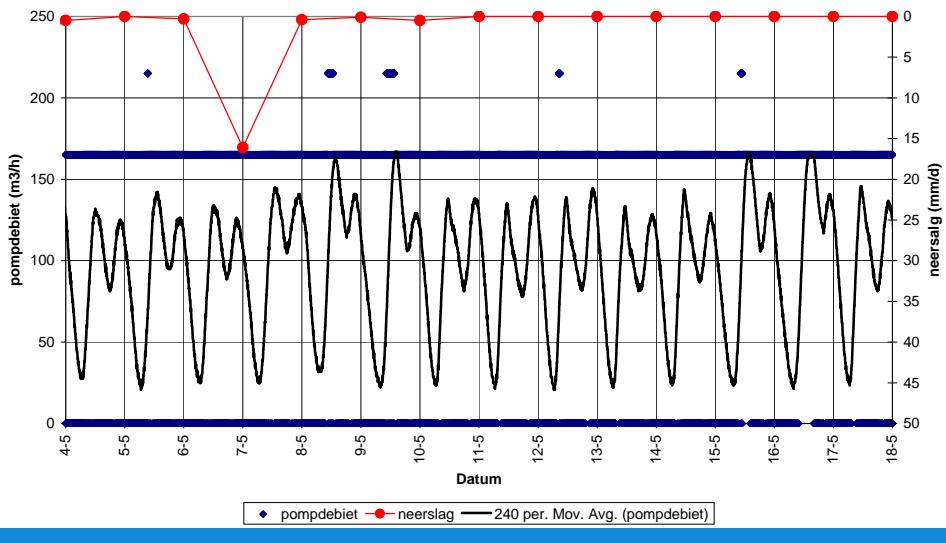

29 novemberr2012

## Interactions within wastewater systems

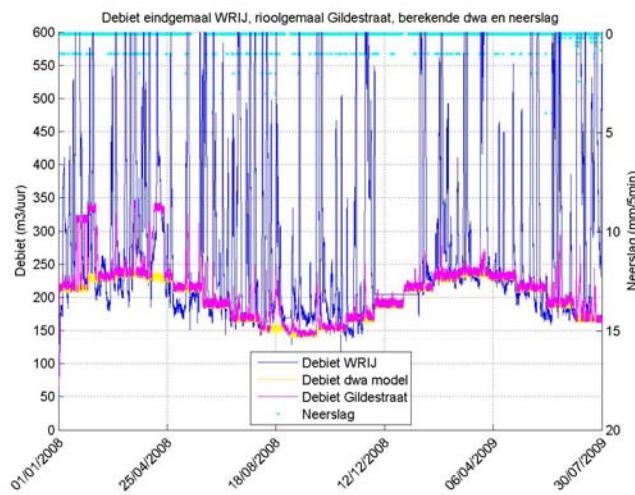

## DWF variations: diurnal and week profile

Relatie neerslag - verpompt debiet gemaal De Laar

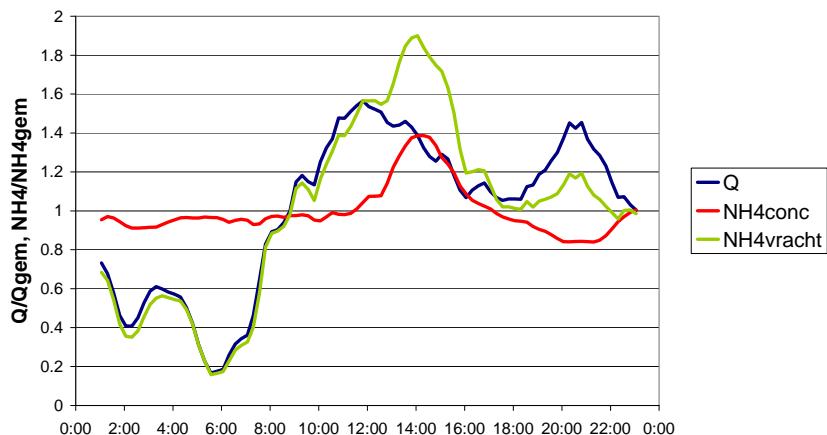

## Annual profile

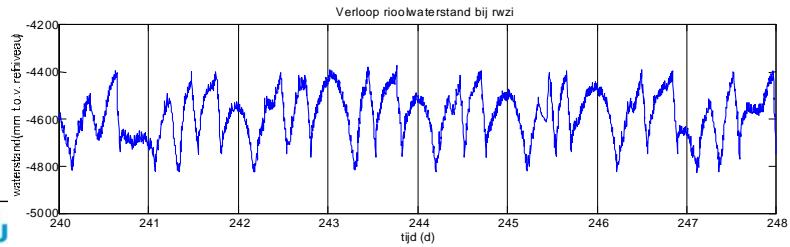

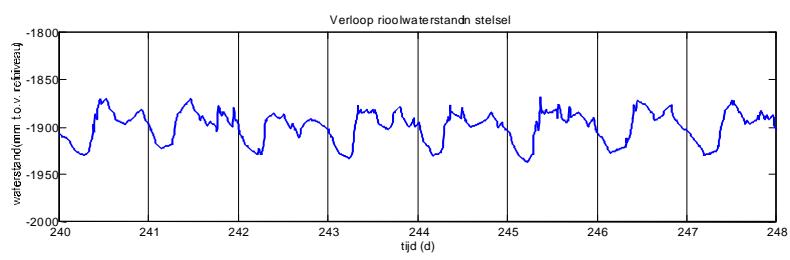

## Impact transport system

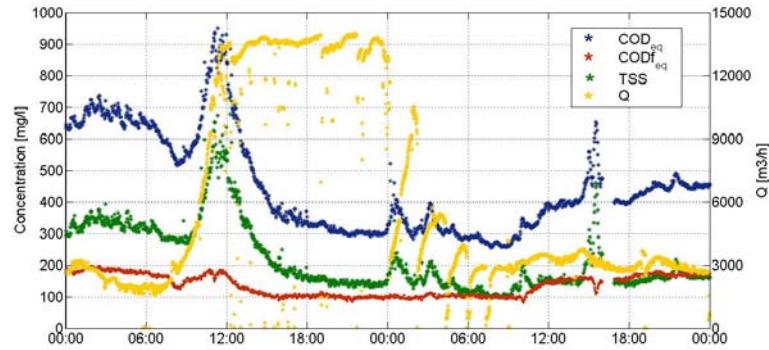

DWA profiel

## Impact pumping station

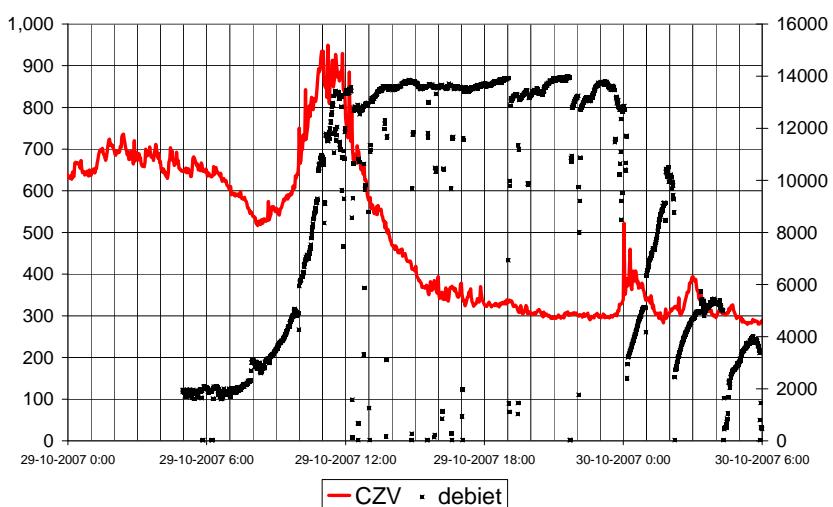

## WWF: storm event 29/30 October 2007

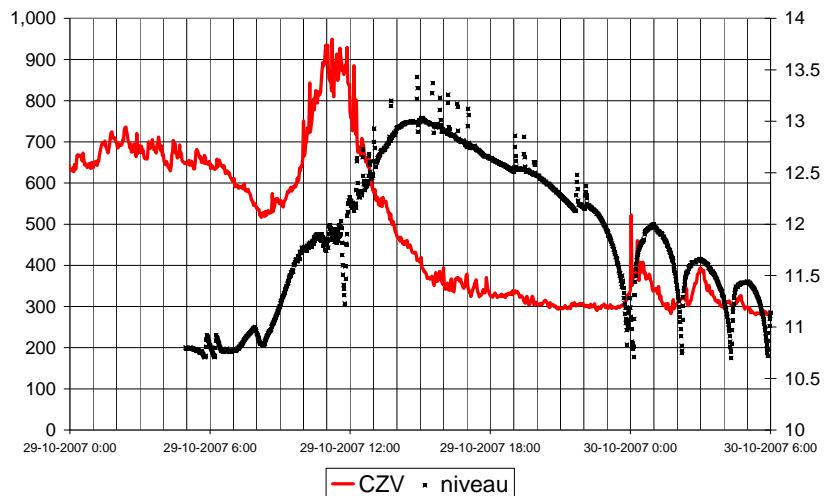

- Eindhoven Stad
- Dilution ~ factor 2
- Overall increase of loads during storm events

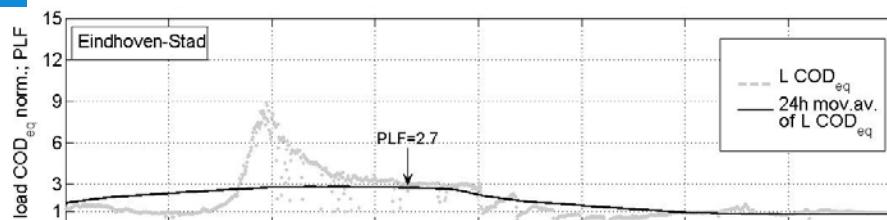

## WWF dynamics: first flush?

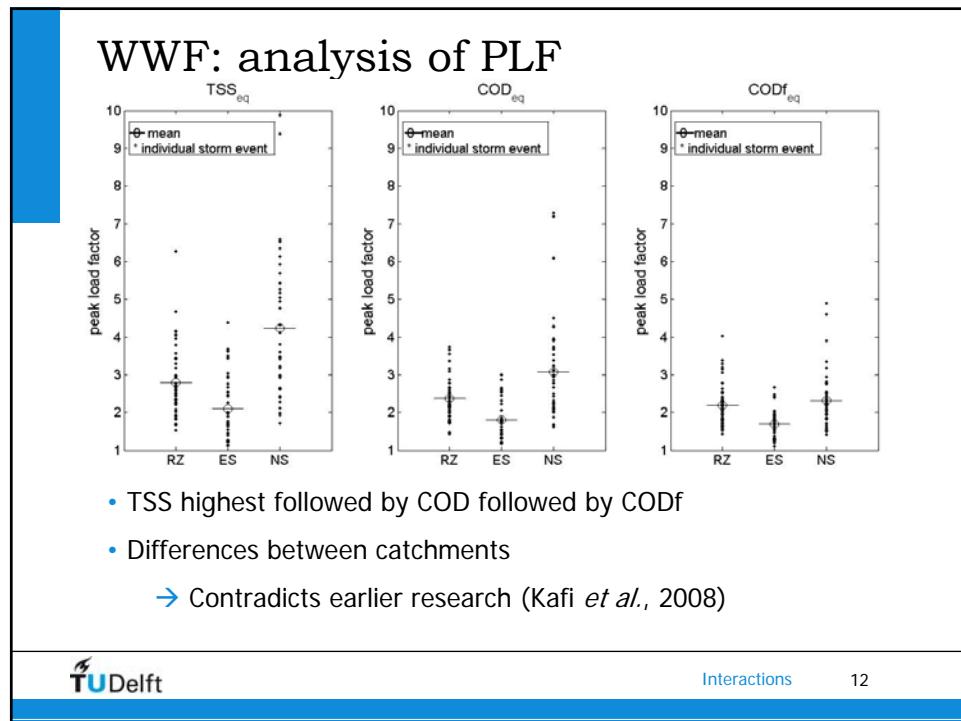

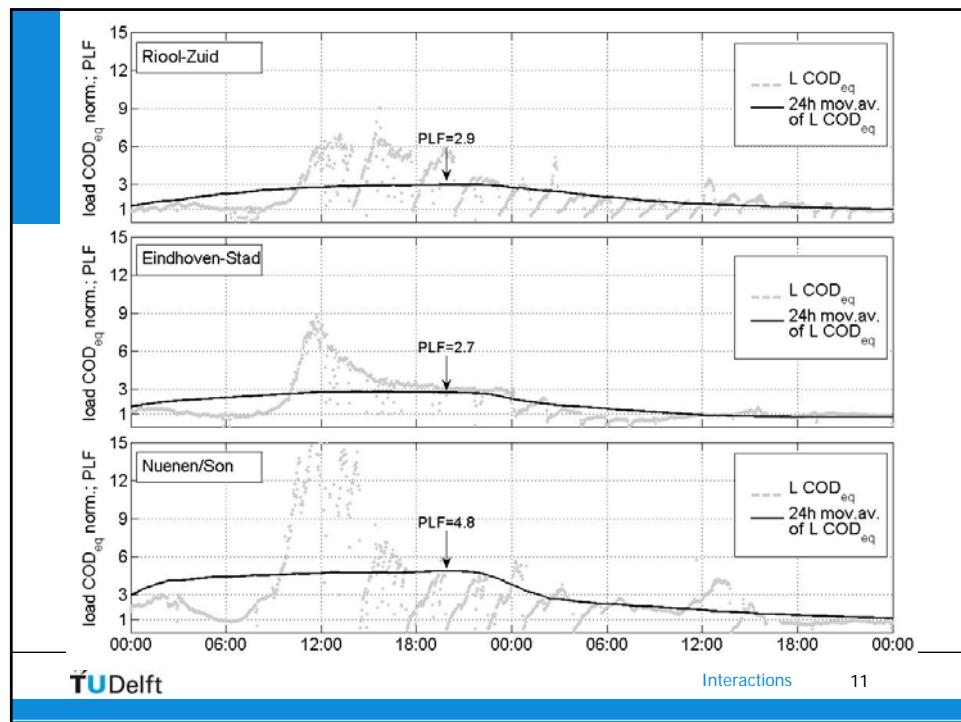

## WWF dynamics: first flush??

## WWF: storm event 29/30 October 2007

- Normalization of concentration & flow
- Calculation of normalized load
- 24h moving average of loads → Peak Load Factor

## WWF: origin of additional pollutant loads

- total mass of pollutants ( $M_{pt}$ ):
  - in-sewer stocks ( $M_{ps}$ )
  - run-off ( $M_{pr}$ )
  - dry weather flow ( $M_{pd}$ )

$$M_{pt} = M_{ps} + M_{pr} + M_{pd}$$

Gromaire *et al.*, 2001

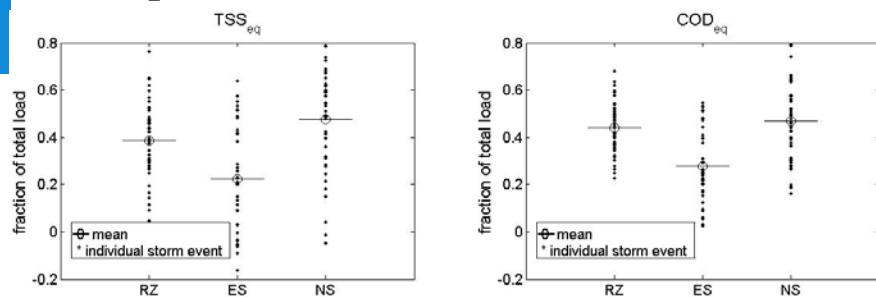

## WWF: origin of additional pollutant loads

- total mass of pollutants → measured
  - in-sewer stocks → ??????
  - run-off →  $(Q_{wwf}-Q_{dwf}) * \text{mean conc. Dutch stormwater}$
  - dry weather flow → measured, equal to DWF conc.

$$M_{pt} = M_{ps} + M_{pr} + M_{pd}$$

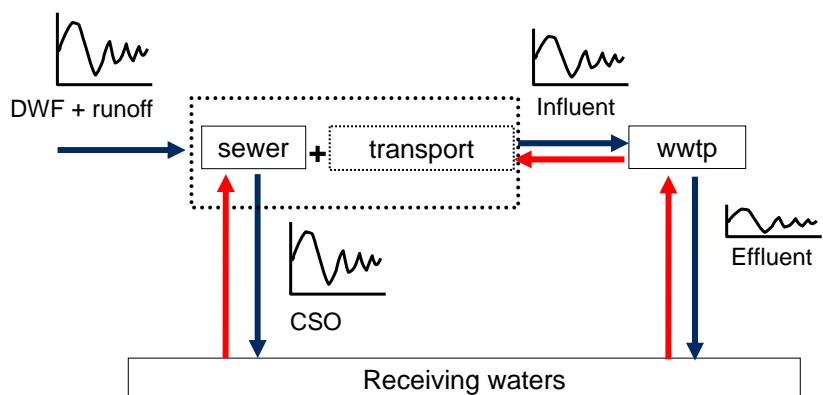

Gromaire *et al.*, 2001

## WWF: origin of additional pollutant loads

- Mean contribution of in-sewer stocks 20-50%
  - Gromaire *et al.* (2001) 50-60%
- Relative contribution in-sewer stocks larger for smaller catchment

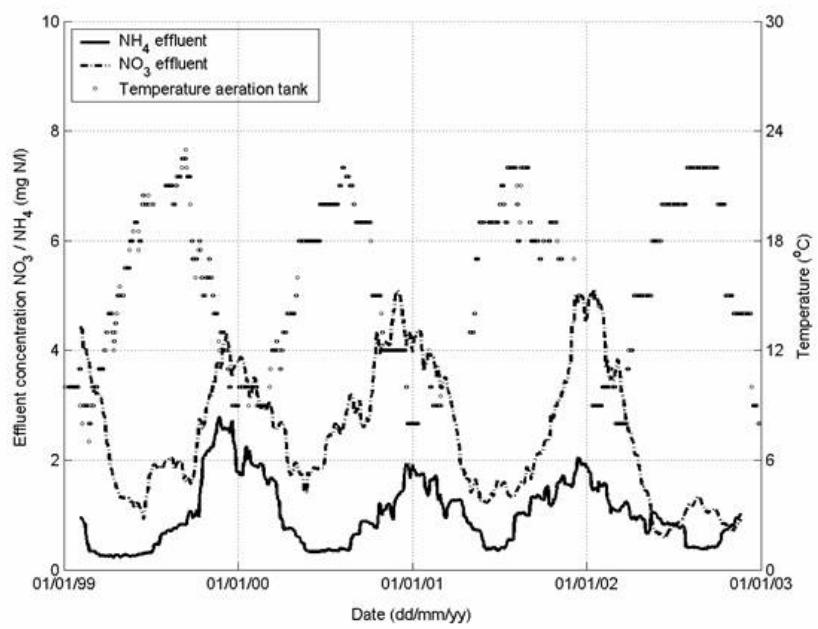

## Interactions within wastewater systems

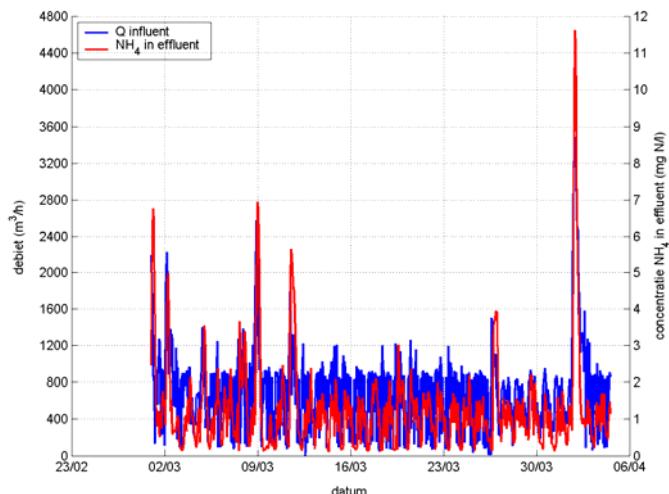

## Impact on wwtp

## Seasonal variation wwtp performance

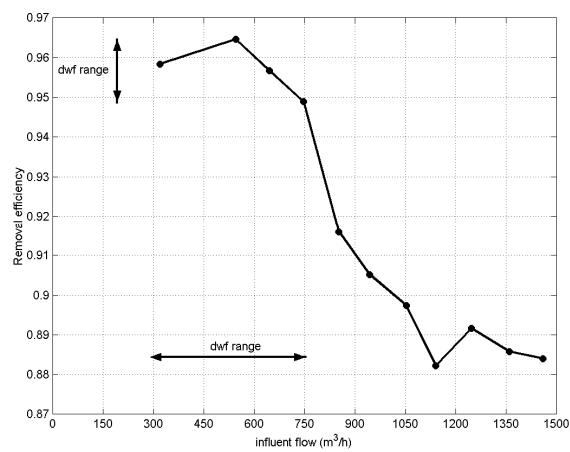

## Short term impacts wwtp performance

s 19

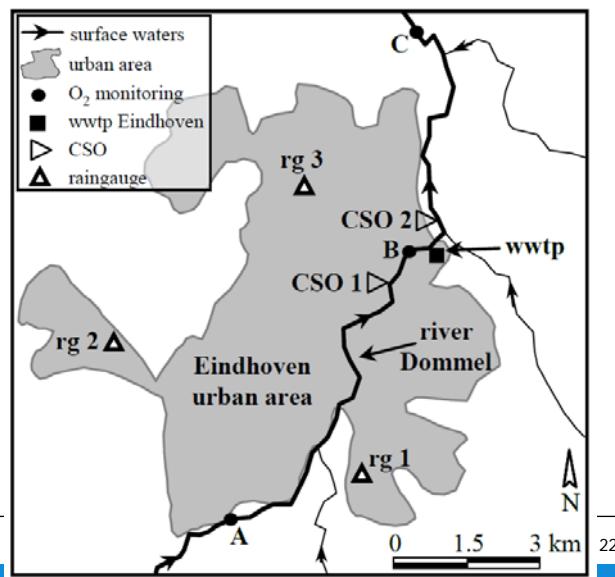

## Short term impacts wwtp performance

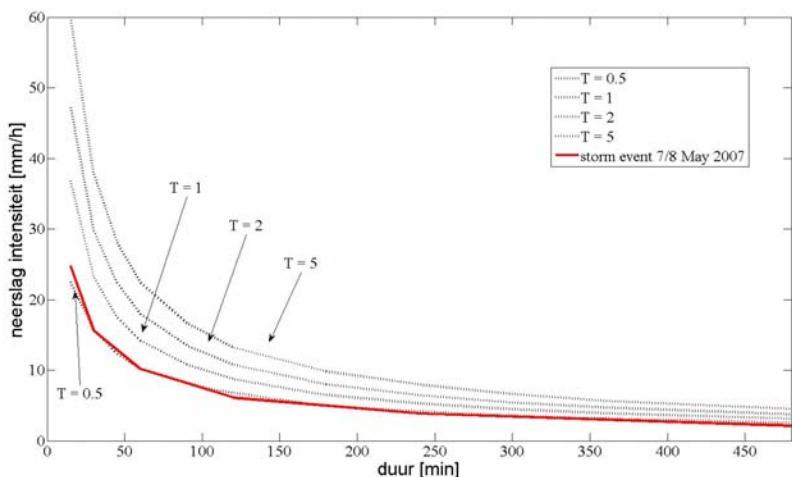

## Interactions in the real world

- Spring 2007: 6 weeks without precipitation finalized by storm event of 33 mm on May 7<sup>th</sup> and 8<sup>th</sup>
- Monitoring data available of wastewater system Eindhoven:
  - wwtp: flow and water quality
  - sewer system: CSO monitoring at CSO vd Heuvellaan and Kosmoslaan: water level and samples for water quality
  - River Dommel: continuous oxygen measurements + sampling for water quality

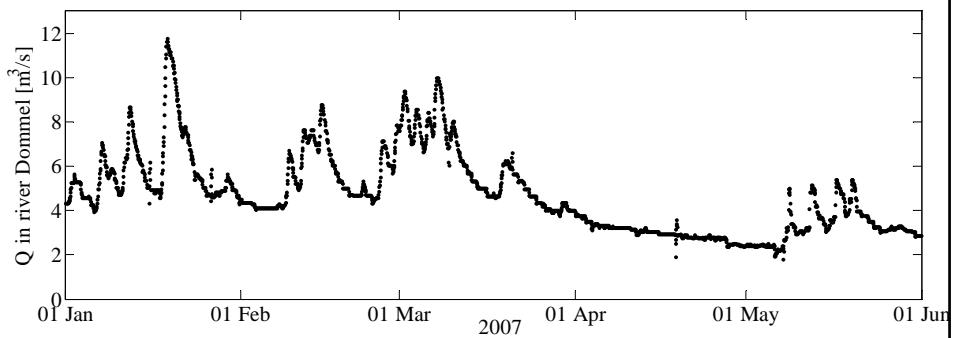

## Monitoring locations Eindhoven area

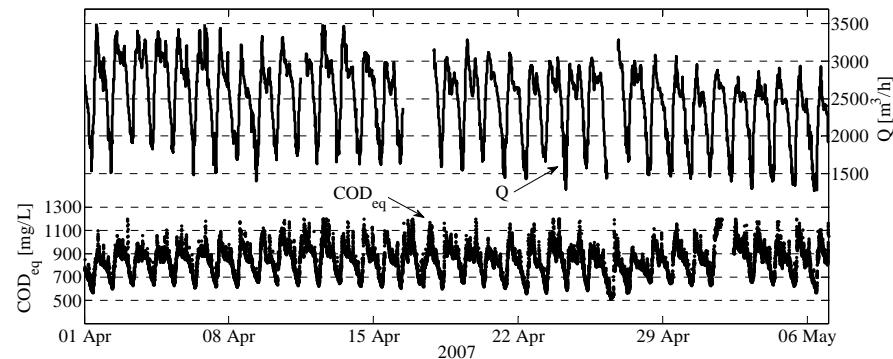

## Storm event May 7/8 2007

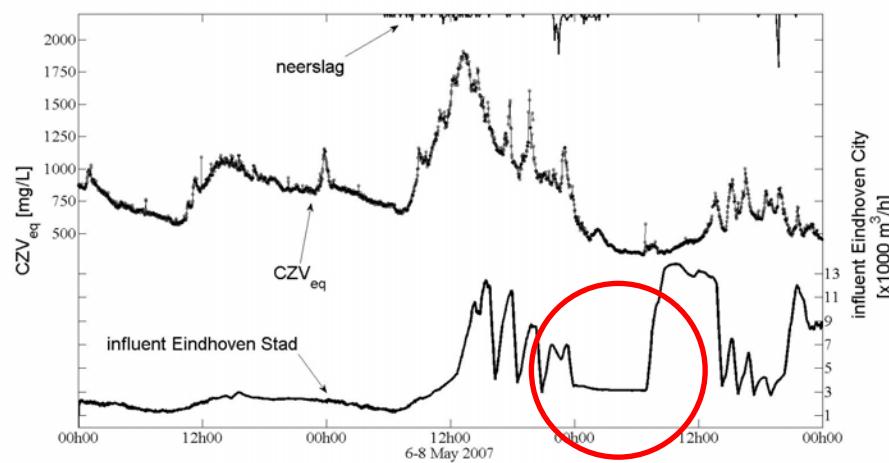

## Flow river Dommel

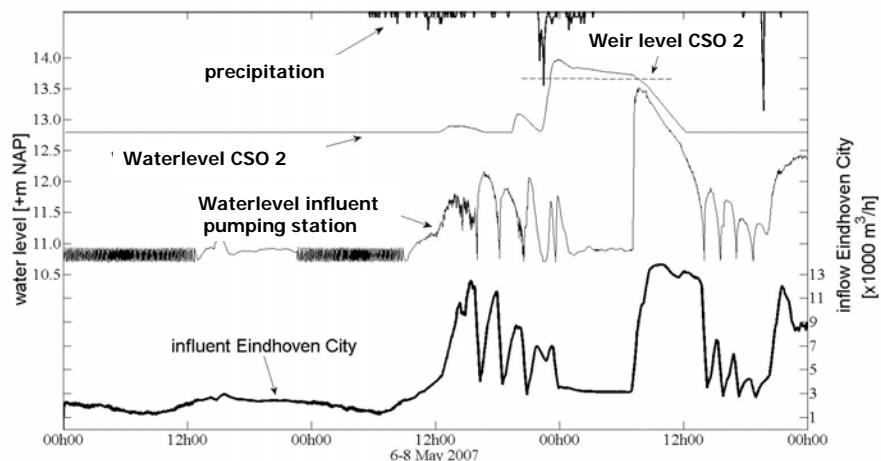

## Influent monitoring: flow and COD

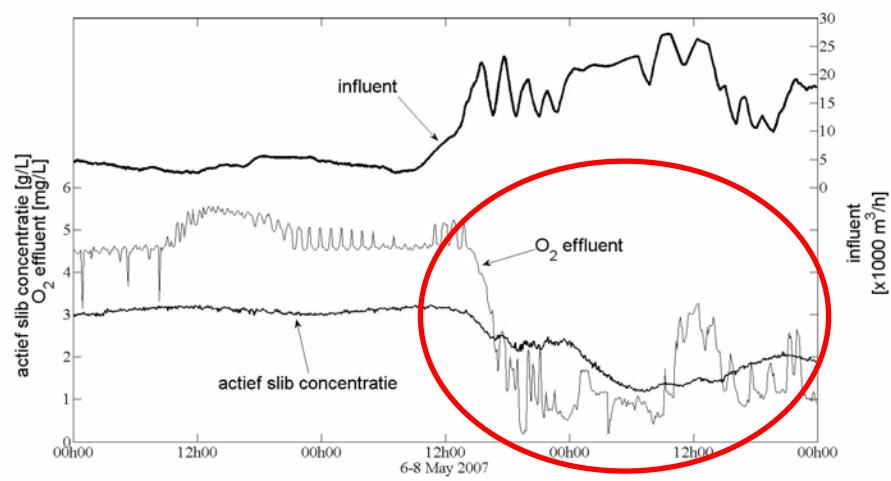

## Hydraulic performance during event

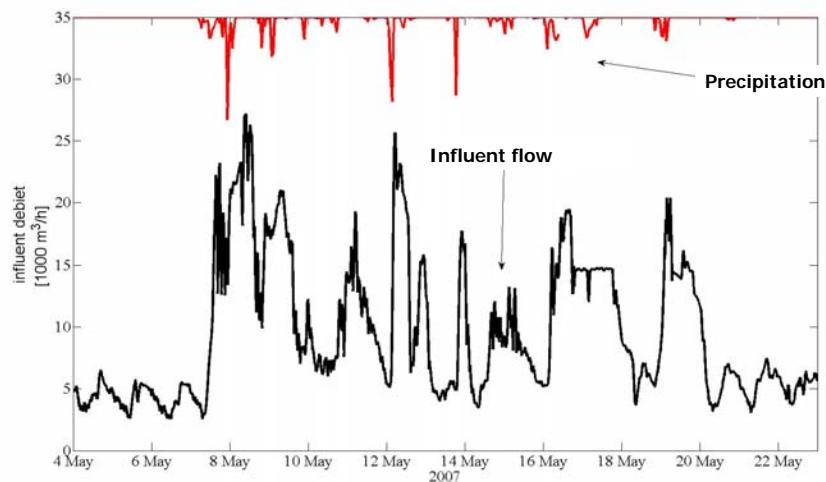

## Hydraulic performance during event

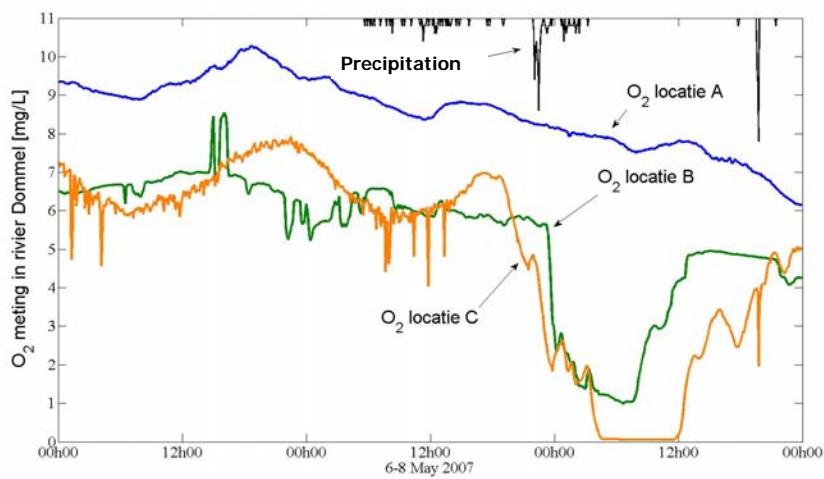

## Impact on wwtp performance during event

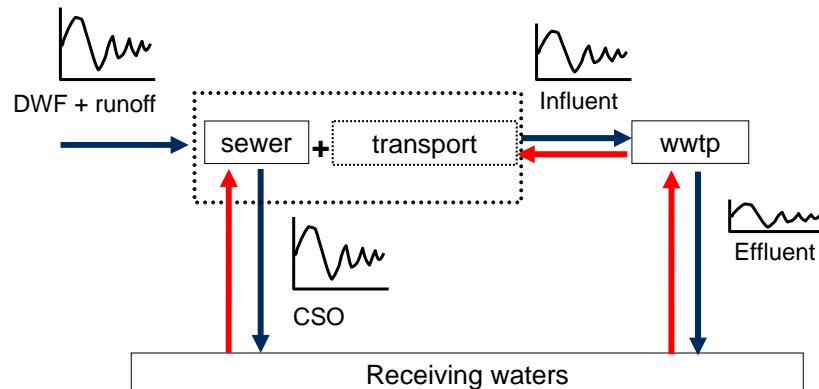

## Impact on wwtp performance after event

## Impact on receiving water quality

## Interactions within wastewater systems: wastewater system optimisation

## Sewer characteristics

- Network
- Below groundlevel
- Dirty
- 'simple pipes'
- Over 100.000 km in NL.
- Municipality
- Focus on hydraulics
- Service life 40-80 year
- Up to 100\* DWF

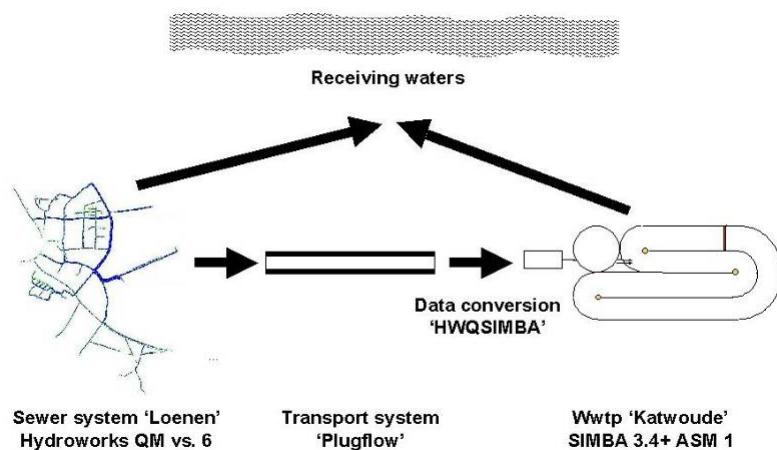

## wwtp characteristics

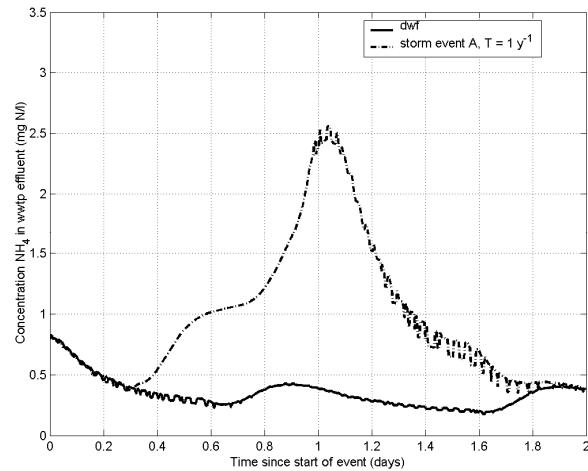

- 1 clear location
- visible
- High tech
- Microbiology/procestechnology
- waterboard
- Service life 20 year
- Up to 3-4\* DWF

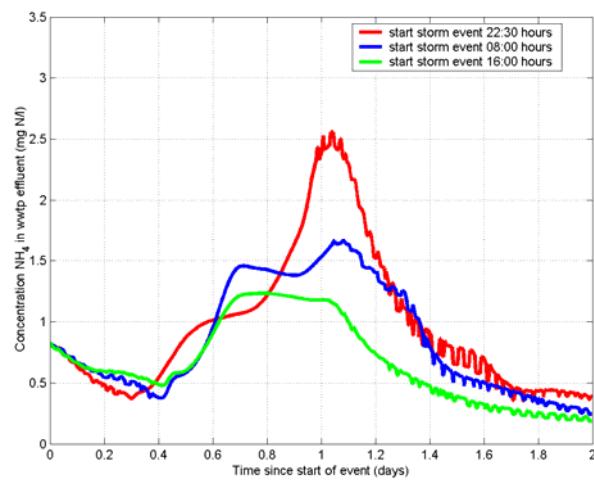

## Example

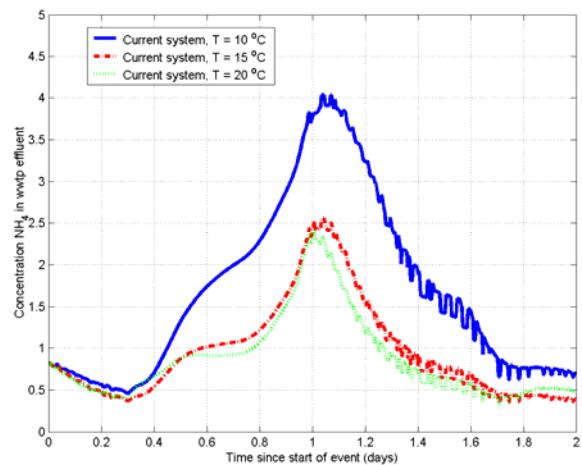

## Impact of storm event

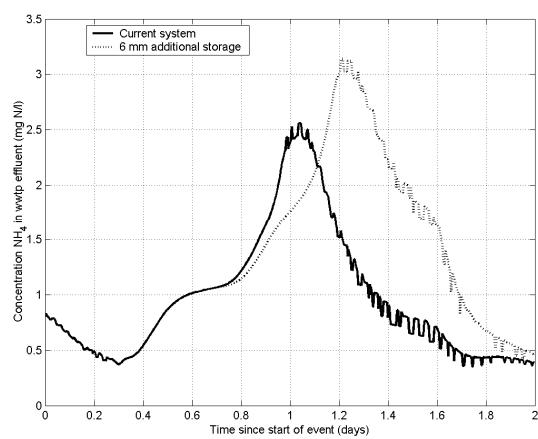

## Impact of timing of storm event

## Impact of temperature

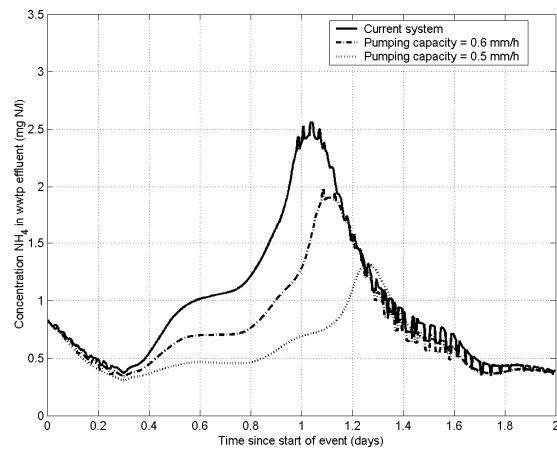

## Impact of additional storage in sewer

## Impact of storage on loads

Point of discharge	Ammonium load (kg NH <sub>4</sub> -N)		N <sub>total</sub> load (kg N)		COD <sub>biodegradable</sub> load (kg COD)	
	current system	6 mm additional storage	current system	6 mm additional storage	current system	6 mm additional storage
CSO load	13	2	23	4	154	25
wwtp load	36	58	239	326	79	95
total load	49	60	262	330	233	120

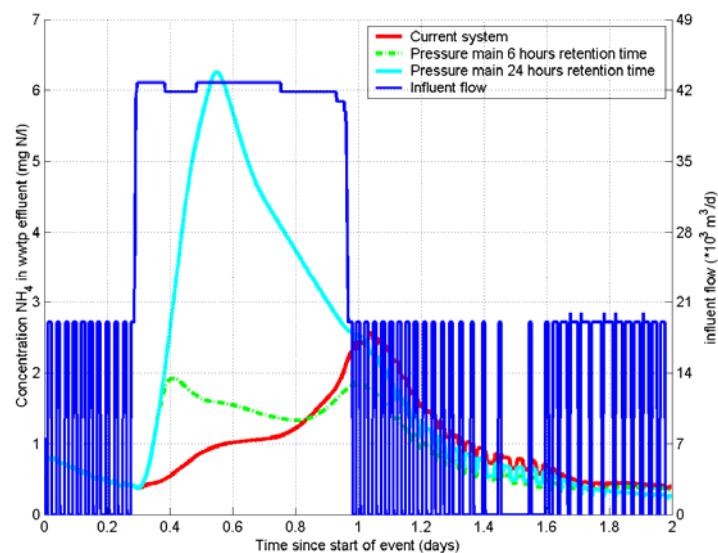

## Impact of pumping capacity

## Impact of pumping capacity on loads

Point of discharge	Ammonium load (kg NH <sub>4</sub> -N)			N <sub>total</sub> load (kg N)			COD <sub>biodegradable</sub> load (kg COD)		
	current system	0.6 mm/h	0.5 mm/h	current system	0.6 mm/h	0.5 mm/h	current system	0.6 mm/h	0.5 mm/h
	0.7 mm/h	0.7 mm/h	0.7 mm/h	0.7 mm/h	0.7 mm/h	0.7 mm/h	0.7 mm/h	0.7 mm/h	0.7 mm/h
CSO load	13	14	16	23	24	29	154	164	196
wwtp load	36	28	19	239	207	176	79	74	69
total load	49	42	35	262	231	204	233	238	264

## Impact of pressure main

## Impact of pressure main

Point of discharge	Ammonium load (kg NH <sub>4</sub> -N)			N <sub>total</sub> load (kg N)			COD <sub>biodegradable</sub> load (kg COD)		
	current system	6 h	24 h	current system	6 h	24 h	current system	6 h	24 h
CSO load	13	13	13	23	23	23	154	154	154
wwtp load	36	49	118	239	236	268	79	97	200
total load	49	62	131	262	258	291	233	251	354

## Conclusions of example

- Timing of storm event determines impact – diurnal pattern, seasonal variation
- wwtp is part of wastewater system: anything you do in one part influences the other parts
- The effect of measures for optimization in a wastewater system depends on the selected parameter
