# Hydrology of catchments, rivers and deltas (CIE5450) 

Prof.dr.ir. Uhlenbrook

Lecture 'Precipitation’

## Hydrology of Catchments, River Basins and Deltas

## Part TWO - Precipitation

Professor Stefan Uhlenbrook, PhD, MSc, habil.
Professor Dr. Ir. Hubert H.G. Savenije
Professor of Hydrology
UNESCO-IHE Institute for Water Education and Delft University of Technology

The Netherlands
E-mail: s.uhlenbrook@unesco-ihe.org s.uhlenbrook@tudelft.nl

## Acknowledgements for the material used in this lecture

- Dr. Pieter de Laat, prof. Huub Savenije, UNESCO-IHE, Delft, The Netherlands
(wrote the course note; some pictures)
- Prof. Tim Link, Idaho, USA (some PPT slides and pictures)
- Prof. Chris Leibundgut, University of Freiburg (some PPT slides and pictures)
- Prof. Demetris Koutsoyiannis (Athens, Greece) and prof. Andreas Langousis (Cambridge, USA) (some PPT slides and pictures)

## Elements of the Hydrological Cycle

## Objectives of this Lecture

- Types of precipitation
- Precipitation formation processes
- Precipitation parameters
- Measurement techniques for precipitation
- Areal estimation of precipitation

## Precipitation

- Rain (light - heavy), snow, drizzle, hail, ...
- Formed from water vapor in the atmosphere:
- Air rises and/or cools (i.e. expansion due to less pressure)
- Cool air can hold only less water
- Need of areosols (nuclei for droplets or ice crystals)
- Excess water forms droplets (mainly in light clouds) or ice crystals (needed for 'real' precipitation)
.... when they are large (heavy) enough, they fall as precipitation!
- Lapse rate (less pressure, expansion, temperature decrease):
- $0.65 \mathrm{~K} / 100 \mathrm{~m}$ (average)
- dry-adiabatic $1.0 \mathrm{~K} / 100 \mathrm{~m}$
- wet-adiabatic 0.5-0.6 K/100 m (air is moisture saturated)

## Different types of precipitation

 Falling precipitation
## Different types of precipitation

 ,Intercepted' precipitation
## solid

liquid

## Objectives of this Lecture

- Types of precipitation
- Precipitation formation processes
- Precipitation parameters
- Measurement techniques for precipitation
- Areal estimation of precipitation

## Precipitation

- Rain (light - heavy), snow, drizzle, hail, ...
- Formed from water vapor in the atmosphere:
- Air rises and/or cools (i.e. expansion due to less pressure)
- Cool air can hold only less water
- Need of areosols (nuclei for droplets or ice crystals)
- Excess water forms droplets (mainly in light clouds) or ice crystals (needed for 'real' precipitation)
.... when they are large (heavy) enough, they fall as precipitation!
- Lapse rate (less pressure, expansion, temp. fall):
- $0.65 \mathrm{~K} / 100 \mathrm{~m}$ (average)
- dry-adiabatic $1.0 \mathrm{~K} / 100 \mathrm{~m}$
- wet-adiabatic 0.5-0.6 K/100 m (air is moisture saturated)

## Vapor Pressure

- Partial pressure of $\mathrm{H}_{2} \mathrm{O}$ in air is the vapor pressure
- Units of pressure are: Pascals (Pa) $\mathrm{M} \mathrm{L}^{-1} \mathrm{~T}^{-2}: \mathrm{kg} \mathrm{m}^{-1} \mathrm{~s}^{-2}$
- Also expressed in bars, millibars (mb)

$$
\begin{aligned}
& 1 \mathrm{bar}=100,000 \mathrm{~Pa}=1 \times 10^{5} \mathrm{~Pa} \\
& 1 \mathrm{mb}=100 \mathrm{~Pa}=1 \times 10^{2} \mathrm{~Pa}
\end{aligned}
$$

- Less frequently
- atm, psi, mm Hg, inH2O

## Composition of the atmosphere

|  | Mass \% | Volume $\%$ |
| :---: | :---: | :---: |
| Nitrogen $\mathrm{N}_{2}$ | 75.5 | 78.1 |
| Oxygen $\mathrm{O}_{2}$ | 23.1 | 20.9 |
| Argon A | 1.3 | 0.9 |
| Others | 0.1 | 0.1 |

## Saturation Vapor Pressure - Temperature

 Relationship

Water damp (gas) ( $\mathrm{g} / \mathrm{m}^{3}$ air)
Temperature $\left({ }^{\circ} \mathrm{C}\right)$
30.4
$+30 \quad+20 \quad+10 \quad 0 \quad-10 \quad-20$

## Saturation Vapor Pressure Curve

Approximated by:

$$
e_{s}=0.611 \cdot \exp \left(\frac{17.3 \cdot T_{s}}{T_{s}+237.3}\right)
$$

vapor pressurein kPa temperature in ${ }^{\circ} \mathrm{C}$

Or, use vapor pressure tables!

Relation between saturation vapour pressure of the air $e_{s}$ and air temperature $T_{a}$
vapour pressure

$\mathbf{e}_{\mathrm{d}}$ : dewpoint vapour pressure $e_{s}$ : saturation vapour pressure $e_{s}-e_{d}$ : Saturation vapour pressure deficit

- Relative humidity [\%]: $\mathbf{R H}=\frac{\mathbf{e}_{\mathbf{d}}}{\mathbf{e}_{\mathrm{s}}} \mathbf{1 0 0}$

## Measures of Humidity

- Vapor pressure ( $\mathrm{e}_{\mathrm{a}}$ )
- partial pressure of $\mathrm{H}_{2} \mathrm{O}$ vapor in air
- Relative humidity: $\mathbf{R H}=\frac{\mathbf{e}_{d}}{\mathbf{e}_{s}} \mathbf{1 0 0}$
- Vapor pressure deficit: es - ed
- Dew point temperature $\left(\mathrm{T}_{\mathrm{d}}\right)$ :
- The temperature at which air with a given vapor pressure would be saturated
- Compute by solving satvp Eqn, or use tables (previous slides)

Note: $e_{a}, T_{d}$ are relatively stable in nature, over short time periods !!

## Example Calculation

On a warm summer day, the air temperature is reported to be $29^{\circ} \mathrm{C}$ with a relative humidity of 40\%

- What is the saturated vapor pressure?
- What is the dew point temperature?

In the evening, the temperature drops to $16^{\circ} \mathrm{C}$
-What is the relative humidity?

## Exercise

Given:
wet bulb temperature $\mathrm{t}_{\mathrm{w}}=23^{\circ} \mathrm{C}$ dry bulb temperature $\mathrm{t}_{\mathrm{a}}=35^{\circ} \mathrm{C}$

What is the relative humidity?

1. calculate $\mathrm{e}_{\mathrm{s}}\left(\mathrm{t}_{\mathrm{a}}\right)=5.65 \mathrm{kPa}$
2. calculate $e_{d}=e_{s}\left(t_{w}\right)-\gamma\left(t_{a}-t_{w}\right)$ $=2.82-0.066(35-23)=2.03$
3. $\mathrm{RH}=2.03 / 5.65=36 \%$

## Adiabatic lapse rate and the stability of the atmosphere

Remark: change of actual temperature of atmosphere with height is often not linear!

## Causes of Precipitation

## (Processes that produco uplift of air masses)

## Convection

- Warm air rises (due to energy input), cools, and forms clouds and potentially thunderstorms
- Fronts
- E.g. warm, wet air (lighter, above) front rides over cold dry air (heavier, beneath)
- Orography - induced by mountains
- Warm, moist air rises over mountains and releases water
- (Cool, dry air falling from mountains has little moisture)
- Convergence - occurs in tropics, ITCZ
- forces to uplift warm and moist air
- Cyclones, tropical depressions or hurricanes

## Formation of a convective storm

## Stages of development of convective cells

## (from Koutsoyiannis and Langousis, 2009; adapted from Weisman

 and Klemp, 1986)$\mathrm{z} \approx 10-12 \mathrm{~km}$
$\mathrm{z} \approx 6 \mathrm{~km}$
$\mathrm{Z}=0 \mathrm{~km}$

$\longleftarrow 6-8 \mathrm{~km} \longrightarrow$
cumulus stage
$10-20 \mathrm{~min}$
$\square$ mature stage
$15-30 \mathrm{~min}$

dissipating stage
$\approx 30 \mathrm{~min}$

## Convective Storms

## Convective Storms

Air rises (vertical instability), cools, condensation, precipitation

- Form - rain, hail
- High Intensity, may exceed 40 mm/hr

Duration - short (minutes to hours)

- Scale - ~1-10s km
- Common in the tropics, or during summer in temperate zone
- Can produce flash floods
- Lightning

## Causes of Precipitation

(Processes that produce uplift of air masses)

- Convection
- Warm air rises (due to energy input), cools, and forms clouds and potentially thunderstorms
Fronts
- E.g. warm, wet air (lighter, above) front rides over cold dry air (heavier, beneath)
- Orography - induced by mountains
- Warm, moist air rises over mountains and releases water
- (Cool, dry air falling from mountains has little moisture)
- Convergence - occurs in tropics, ITCZ
- forces to uplift warm and moist air
- Cyclones, tropical depressions or hurricanes

## Frontal Precipitation

Frontal lifting of air masses

## Schematic illustration of different types of fronts: a) cold front, b) warm front, and c) occluded front

(Koutsoyiannis and Xanthopoulos, 1999)

## Frontal Precipitation

Very common in humid temperate zone (west wind zone), in particular during fall, winter and spring

- Form - rain or snow
- Intensity - generally low to moderate ~10 $\mathrm{mm} / \mathrm{h}$ or less
- Duration - long (hours to days)
- Scale - >100 km

A front comes in ....

North Pacific Satellite Images Mon. - Tues Jan 21-22, 2002

## Causes of Precipitation

(Processes that produce uplift of air masses)

- Convection
- Warm air rises (due to energy input), cools, and forms clouds and potentially thunderstorms
- Fronts
- E.g. warm, wet air (lighter, above) front rides over cold dry air (heavier, beneath)
- Orography - induced by mountains
- Warm, moist air rises over mountains and releases water (Cool, dry air falling from mountains has little moisture)
- Convergence - occurs in tropics, ITCZ
- forces to uplift warm and moist air
- Cyclones, tropical depressions or hurricanes

## Orographic Precipitation

## Example

Mountain Meteorology<br>FUNDAMENTALS AND APPLICATIONS

Orographic precipitation is difficult to
catch with a picture ...

## In the rain shadow!

 Daum $2144.1998,17.00 \mathrm{MOZ}$, Blick E © Copyright BerihardMO

## Orographic Precipitation

Common in mountainous regions, sometimes connected to frontal systems

- Form - rain or snow
- Intensity - low to moderate $\sim 10 \mathrm{~mm} / \mathrm{h}$; high intensities when sharp rise of the mountains
- Duration - long (hours to days); shorter if additional convection
- Scale - >10-100 km

## Example: State of Washington, USA, Annual Precipitation Distribution

## Causes of Precipitation

(Processes that produce uplift of air masses)

- Convection
- Warm air rises (due to energy input), cools, and forms clouds and potentially thunderstorms
- Fronts
- E.g. warm, wet air (lighter, above) front rides over cold dry air (heavier, beneath)
- Orography - induced by mountains
- Warm, moist air rises over mountains and releases water
- (Cool, dry air falling from mountains has little moisture)
- Convergence - occurs in tropics, ITCZ
- forces to uplift warm and moist air
- Cyclones, tropical depressions or hurricanes

# Precipitation through convergence at ITCZ 

## Wind system for a hypothetical water-covered Earth

## Views of the Planet Earth

## Precipitation through convergence at ITCZ

- Monsoon
- defines rainy / dry seasons
- one or two rain seasons depending on ITCZ movement

Fig. 2.3 Position of the Inter-Tropical Convergence Zone in January (top) and July (below)

$$

## Causes of Precipitation

(Processes that produce uplift of air masses)

- Convection
- Warm air rises (due to energy input), cools, and forms clouds and potentially thunderstorms
- Fronts
- E.g. warm, wet air (lighter, above) front rides over cold dry air (heavier, beneath)
- Orography - induced by mountains
- Warm, moist air rises over mountains and releases water
- (Cool, dry air falling from mountains has little moisture)
- Convergence - occurs in tropics, ITCZ
- forces to uplift warm and meist air
- Cyclones, tropical depressions or hurricanes

## Cyclones, tropical depressions or hurricanes

- Active depressions moving over warm ocean water; taking up moisture and energy
- Can cause high intensity rainfall for relatively long times
- Often follow different probability distribution in statistical analysis (extreme value statistics; mixed distributions)

TRMM microwave imager (TMI) rainfall retrievals for hurricane Katrina on 28 August 2005 at 21:00 UTC (frame 44373): Different types of rain bands and their location relative to the centre of the storm
(Koutsoyiannis and Langousis, 2009 )

## Schematic representation of the structure of a mature hurricane

 Langousis, 2009 )

## Mixed distribution of combined cyclonic storms and thunderstorms

## Objectives of this Lecture

- Types of precipitation
- Precipitation formation processes
- Precipitation parameters
- Measurement techniques for precipitation
- Areal estimation of precipitation

## Precipitation Parameters

- Amount of precipitation - units of depth (e.g. $\mathrm{l} / \mathrm{m}_{2}=$ mm)
- The duration of event or period - units of time (e.g. min, hour, day, month, year etc.)
- Intensity = amount/duration (e.g. $\mathrm{mm} \mathrm{h}^{-1}$ )
- May be for all or only part of the total duration of the storm
- seconds, minutes, hours, days, years, ...
- Long durations have usually greater amounts
- Shorter durations have usually greater intensities
- Graph of precipitation vs. time is a hyetograph
- Seasonal distributions, depending on atmospheric circulation patterns

## Temporal distribution (1/2)

## Temporal distribution (2/2)

Fig. 8 Time series of a storm in Iowa, USA measured at the University of lowa with temporal resolution of 10 seconds (Georgakakos et al., 1994); time zero corresponds to 1990-02-12T17:03:39.
(Koutsoyiannis and Langousis, 2009 )

## Rainfall data

## Rainfall-intensity distribution

Typical percentage mass curves of rainfall for

## Frequency analysis

Figure .16
Frequency distribution of 1, 10 and 30 day rainfall (a); hystogram of daily rainfall (b)

| \# | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 |

## Observed extreme precipitation data around the world

## Observed extreme precipitation data World vs. United Kingdom

Magnitude-duration relationship for the world and the UK extreme rainfalls (source: Ward \& Robinson, 1990).

# Evolution of global precipitation based on averaged monthly data from GPCP for 1979-2008 

(Koutsoyiannis and Langousis, 2009 )

Annual precipitation time series of two stations with the longest records worldwide: Seoul, Korea (upper); Charleston City, USA (lower) (data source: KNMI; climexp.knmi.nl)

## Rainfall data screening

cumulative annual
precipitation (m)
station X

cumulative annual
precipitation (m)
mean of other stations

## Spatial homogeneity:

$$
\mathrm{P}_{\text {est }}=\frac{\sum\left(\mathrm{P} / \mathrm{r}^{\mathrm{b}}\right)_{\mathrm{i}}}{\sum\left(1 / \mathrm{r}^{\mathrm{b}}\right)_{\mathrm{i}}}
$$

## Correlation between rainfall stations

## Kagan's formula:

$\rho(\mathbf{r})=\rho_{0} \mathbf{e}^{\mathrm{r}_{0}}$

| Rain type | Period 1 hour |  | Period 1 day |  | Period 1 month |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \mathbf{r}_{\mathbf{0}} \\ (\mathbf{k m}) \end{gathered}$ |  | $\begin{array}{r} \mathbf{r}_{\mathbf{o}} \\ (\mathbf{k m}) \end{array}$ |  | $\begin{gathered} \mathbf{r}_{\mathbf{0}} \\ (\mathbf{k m}) \end{gathered}$ | $\mathbf{p}_{0}$ |
| Very local convective | 5 | 0.80 | 10 | 0.88 | 50 | 0.95 |
| Mixed convective orographic | 20 | 0.85 | 50 | 0.92 | 1500 | 0.98 |
| Frontal rains from depressions | 100 | 0.95 | 1000 | 0.98 | 5000 | 0.99 |

## Areal Reduction Factor

$$
A R F=P_{a} / P_{p}
$$

ARF is a function of:

- rainfall depth
- storm duration
- storm type
- catchment size
- return period

## Tipping Bucket Gauge

## Measurement of the ,real' precipitation on the ground

## Systematic errors during rainfall measurements

- Deformation of the wind array above the gauge (rain about 2-5 (up to 10) \%; snow 10-40 (or even more!) \%)
- Wetting losses at the gauge (inside) and in the tank (up to 5-10 \%)
- Evaporation of collected precipitation (up to 1-3 \%)
(Blow out of collected precipitation (i.e. snow) out of the gauge)

## Effect of Wind on Precipitation Measurements

FIGURE 4-15
Wind effects of projecting rain gages. (a) Without wind shielding, upward-moving air in eddies prevents many snowflakes from entering the gage. Rigid Niphertype shields (b) or hinged Altertype shields (c) reduce this effect. After Bruce and Clark (1966).

## Effect of Wind on Precipitation Measurements

Fig. 2.5 Effect of wind speed on rain catch

## - Do you belief me??

## Alter-type Wind Shield

## 

## Measuring Rainfall

- A rain gauge is a single point observation
- Locate away from objects
-Best if sheltered from wind

## Comments ...??

## Comments ...??

## Russian-style wind shield

## Heated-orifice gauge

## Objectives of this Lecture

- Types of precipitation
- Precipitation formation processes
- Precipitation parameters
- Measurement techniques for precipitation
- Areal estimation of precipitation

## Estimating Areal Rainfall Distribution

- Large watersheds require a number of gages
- Limited by costs and time
- Flat areas need usually fewer stations
- Consider topographic effects
- Try to distribute uniformly
$>$ Access may be a problem in remote areas

## Average Precipitation Estimation

- Arithmetic average
- If gages are evenly distributed and relief is not important
- Thiessen Method/Thiessen Polygons: Weighted average
- Determine representative area for each gage
- Isohyetal or "contour" area weighted average
- Draw lines of equal rainfall amounts, like a topographic contour map
- Algorithmic Hypsometric Methods
- Kriging, Inverse distance weighting, PRISM, ANUSPLIN

a)

## Thiessen Polygons

## Example:

## How to estimate basin precipitation by area

 weighted averages?| Amount, mm | Area, hectar | Weighted <br> amount |  |
| :--- | :---: | :---: | :--- |
| 8.81 | 65 |  |  |
| 12.15 | 150 |  |  |
| 15.26 | 269 |  |  |
| 13.18 | 216 |  |  |
| 5.62 | 56 |  |  |
| Total: | 9.8 | 136 |  |
|  |  |  |  |
|  | (arithmetic mean) | (Catchment area) | (weighted mean) |

## Isohyetal Method

(Hornberger et al., 1998)

## Isohyetal Method

## FIGURE 4-26

The isohyetal method of integration. Dots are precipitation-gage locations; thin lines are isohyets; shaded zone is the area $a_{i}$ between the $p_{i-}$ and $p_{i+}$ isohyets.

# Making rainfall maps helps also to control the quality of different stations 

Example from the Dreisam catchment, Black Forest Mountains, Germany

Can this one be correct??

## Regionalisation models, e.g. PRISM

PRecipitationelevation on Independent Slopes Model

## Measurement of Areal Distribution of Precipitation

Fig. 2.7 Forms of radar display: PPI (left) and RHI (right)

## Rainfall Radar

 Observation of the space-time variability

## European Rainfall Radar Stations

## German Rainfall Radar Stations

## German Rainfall Radar Stations and Automatic Raingauges (on-line)

Automatische Niederschlagsstationen des DWD und der Länder im Messnetz 2000
(Planungsstand 21.05.2002)

## Space-time Variability of Precipitation during a Huge Event in the Blue Ridge Mountains, USA (values give in mm per event!)

(a) Storm track

(b) Total rainfall accumulation

## Take Home Messages

- Remember the different types of precipitations (often mixtures in reality)
- Main precipitation formation mechanism:
- (i) convection,
- (ii) frontal,
- (iii) orography,
- (iv) convergence, and
- (v) cyclones, tropical depressions and hurricanes
- Characterization of precipitation through different parameters
- Measurement of precipitation (devices and techniques)
- Areal estimations of precipitation (different methods); when is which method appropriate?

## Brief Introduction to Frequency Analysis

$\mathrm{P}\left(\mathrm{X}>\mathrm{X}_{0}\right) \quad$ Probability of exceedance, probability that X is greater than or equal to $\mathrm{X}_{0} ; 0 \leq \mathrm{P} \leq 1$
$\mathrm{T}\left(\mathrm{X}>\mathrm{X}_{0}\right) \quad$ Return Period or average recurrence interval, the average (!) time in years between the occurrence of an extreme event X

T and P are as follows related

$$
T=\frac{1}{P}
$$

Probability the event will not occur next year

$$
\left(1-\frac{1}{T}\right)
$$

Probability the event will not occur the next N years

$$
\left(1-\frac{1}{T}\right)^{N}
$$

Probability the event occurs at least once in the next N years

$$
P=1-\left(1-\frac{1}{T}\right)^{N}
$$

## Frequency analysis (e.g. peak flows)

- Annual maximum series (more common)
$>$ One can miss a large event if more than one large event per year; but continuously/consistent and easy to process
$>$ Often used for estimating extremes in long records (>10 years)
- Partial duration series ("Peaks-Over-Threshold, POT")
$>$ Definition of the threshold is tricky and requires experience
$>$ Often used for short records (<10 years)

## Flood frequency analysis <br> (peak flows):

Annual max. series
vs.
partial duration series
(Davie, 2002)

Figum 7.10 Daily fow record for the Adams river (British Columblia, Cantada) during five years in the 1980 s. Annual maximum series are denoted by 'am', partial duration series above the threshold line by "xil" NB In this record there are five annual maximum ditt: poines and only four partial duration perifts, includina two from within 1981.
Source: Data courtesy ol Environment Canada

Annual max. series vs. partial duration series (POT)

- Langbein showed the following relationship (Chow 1964):

$$
1 / T=1-e^{-\left(1 / T_{p}\right)}
$$

$T$ : return period using annual max. series
$T_{p}$ : return period using partial duration series

- Differences get smaller for larger return periods (less than 1\% difference for a 10-year recurrence interval)!

Given data: Annual maximum daily rainfall of 10 years ( $\mathrm{N}=10$ )

| Year | 1971 | 1972 | 1973 | 1974 | 1975 | 1976 | 1977 | 1978 | 1979 | 1980 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{~mm} / \mathrm{d}$ | 56 | 52 | 60 | 70 | 34 | 30 | 44 | 48 | 40 | 38 |

Rank values in descending order

| m | Rainfall | p | T |
| :---: | :---: | :---: | :---: |
| Rank | amount (mm) | Probability exceedence | Return period |
| 1 | 70 | 0.09 | 11.0 |
| 2 | 60 | 0.18 | 5.5 |
| 3 | 56 | 0.27 | 3.7 |
| 4 | 52 | 0.36 | 2.8 |
| 5 | 48 | 0.45 | 2.2 |
| 6 | 44 | 0.54 | 1.8 |
| 7 | 40 | 0.64 | 1.6 |
| 8 | 38 | 0.73 | 1.4 |
| 9 | 34 | 0.82 | 1.2 |
| 10 | 30 | 0.91 | 1.1 |

Estimate probability of exceedance:

Weibull:
$p=\frac{m}{N+1}$
Gringerton:

$$
p=\frac{m-0.44}{N+0.12}
$$

More on Gumbel and other distributions during the workshop exercises!
