

# Bending Deflection – Method of Superposition

AE1108-II: Aerospace Mechanics of Materials

Dr. Calvin Rans

Dr. Sofia Teixeira De Freitas

# Deflection by Superposition

- If stress-strain behaviour of the beam material remains *linear elastic*, principle of superposition applies

- Problem can be broken down into simple cases for which solutions may be easily found, or obtained from data handbooks (see Appendix C of the textbook)

---

The following slides show all the  
standard solutions you will be  
permitted to use on the exam!

---

# Cantilever Beam Standard Solutions

Deflection (at B)

$$v_B = \frac{qL^4}{8EI}$$

Slope (at B)

$$\theta_B = \frac{qL^3}{6EI}$$

$$v_B = \frac{PL^3}{3EI}$$

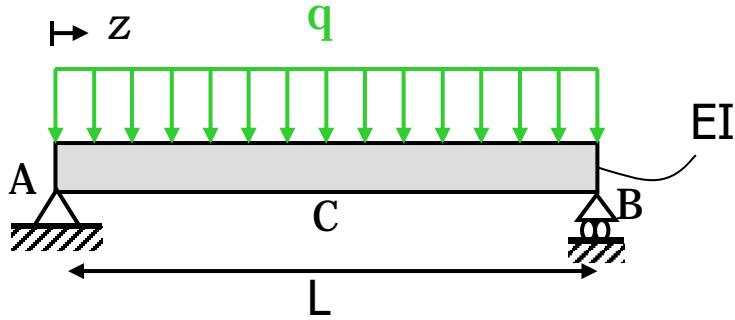

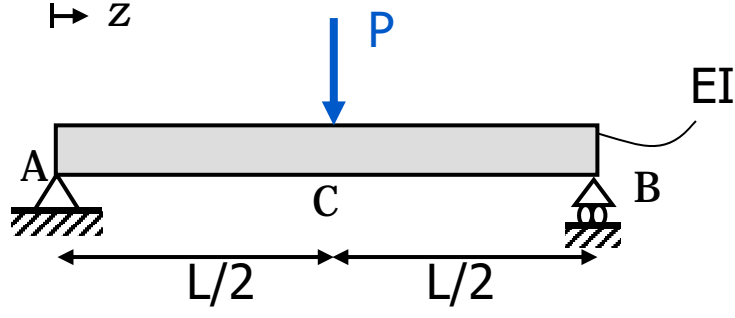

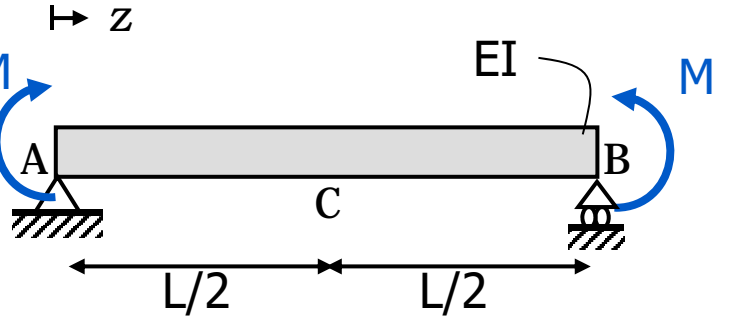

$$\theta_B = \frac{PL^2}{2EI}$$

$$v_B = -\frac{ML^2}{2EI}$$

$$\theta_B = -\frac{ML}{EI}$$

# Simply Supported Beam Standard Solutions

	Deflection	Slope
 <p>Diagram of a simply supported beam of length <math>L</math> with a uniformly distributed load <math>q</math>. The beam is supported at A (left) and B (right). The midpoint is C. The flexural rigidity is <math>EI</math>. A coordinate <math>z</math> is shown pointing to the right.</p>	$v_C = \frac{5qL^4}{384EI}$	$\theta_{A,B} = \frac{qL^3}{24EI}$
 <p>Diagram of a simply supported beam of length <math>L</math> with a point load <math>P</math> at the midpoint C. The beam is supported at A (left) and B (right). The flexural rigidity is <math>EI</math>. A coordinate <math>z</math> is shown pointing to the right.</p>	$v_C = \frac{PL^3}{48EI}$	$\theta_{A,B} = \pm \frac{PL^2}{16EI}$
 <p>Diagram of a simply supported beam of length <math>L</math> with moments <math>M</math> applied at both ends A and B. The beam is supported at A (left) and B (right). The flexural rigidity is <math>EI</math>. A coordinate <math>z</math> is shown pointing to the right.</p>	$v_C = \frac{ML^2}{8EI}$	$\theta_C = 0$

---

# Example

---

# Example Problem

Find the deflection at B

We can break into two sub problems

+

# Example Problem (cont)

## Sub Problem (1)

$$v_{(1)} = v_C + \theta_C \left( \frac{L}{2} \right)$$

$$v_{(1)} = \frac{7wL^4}{384EI}$$

Standard Solution 1:

$$v = \frac{wL^4}{8EI}$$

$$\theta = \frac{wL^3}{6EI}$$

$$v_C = \frac{w \left( \frac{L}{2} \right)^4}{8EI} = \frac{wL^4}{128EI}$$

$$\theta_C = \frac{w \left( \frac{L}{2} \right)^3}{6EI} = \frac{wL^3}{48EI}$$

# Example Problem (cont)

Sub Problem (2)

$$\therefore v_{(2)} = \frac{PL^3}{3EI}$$

Standard Solution 2:

# Example Problem (cont)

Superposition:

(1)

$$v_{(1)} = \frac{7wL^4}{384EI}$$

+

(2)

$$v_{(2)} = \frac{PL^3}{3EI}$$

$$\therefore v_B = \frac{7wL^4}{384EI} + \frac{PL^3}{3EI}$$
