CT5520 – Drinking water treatment 2

Design project

Loenderveen (Waternet) – Enhancing NOM removal

1. Problem definition

The presence of natural organic matter (NOM) in drinking water influences both the efficiency of treatment steps, and processes in the distribution network such as the formation of biofilms and the uptake of copper and lead.

Seepage water of the Bethunepolder is used as source for drinking water. This water contains much NOM and enhanced NOM removal is required. Develop practical alternatives for the enhanced removal of NOM to solve the problems related to high NOM concentrations. Think about:

- Choice of the system and the materials/media used.
- Place of the system in the pre-treatment (before or after coagulation).
- Variations in source water quality
- Effects of NOM removal on following treatment steps

Detailed information of Treatment plant Loenderveen is given in the annexes.

2. Actual situation

Mostly seepage water from the Bethunepolder is used as source water, but at low water levels in the polder it is also possible to abstract water from the Amsterdam-Rhine canal.

The treatment at Loenderveen consists of coagulation, self-purification in a lake with a residence time of 100 days and rapid sand filtration.

After this pre-treatment, the water is transported to Weesperkarspel.

The post-treatment at Weesperkarspel consists of: ozonation, softening, activated carbon filtration and slow sand filtration.

An overview of several parameters in the raw water is given in table 1:

The treatment plant is characterised by the following data:

Design capacity:

The design flow of the treatment plant can be determined with the following data:

Year capacity:	15 mln m ³
Average daily capacity:	47,000 m ³ /dag
Maximum day factor (peak factor):	1.8
Minimal day factor:	0.7

Coagulation:

Number of basis	2
Surface area per basin:	40x80 m

Lake water reservoir:

Residence time:	about 100 days
Surface area:	123 ha
Volume:	6.9 million m ³

Filters:

Number:	24 filters
Surface area:	48 m ² per filter
Max. filter loading:	6 m/h

Transport mains:

Length:	10 km
Diameter:	2 x 1000mm

Buffering reservoir:

Surface area:	1.12 ha
Volume:	40.000 m ³

Annexes:

1. Water quality
2. Proces scheme
3. Main water flow scheme
4. Hydraulic line scheme
5. Map

Water quality of Treatment plant Loenderveen.
